Peaks® 150
Digital Control for Steam Turbines

The Peak® 150 steam turbine control is a low-cost, compact, digital control for single-valve or single-valve rack steam turbines. It provides convenient operator control and speed display from the front panel. It is housed in a watertight, and dust-tight, enclosure. A corrosion-resistant enclosure designed to meet NEMA 4X requirements is also available.

APPLICATIONS
The Peak 150 digital control is designed to control a steam turbine driving a mechanical load. It provides tight control of speed (NEMA D) and includes an input for a 4–20 mA remote speed control signal, which can be used for a process-generated input to control the speed setting. Other features include dual speed control dynamics and overspeed trip test capabilities.

OPERATION
The operation of the control is simple. To start the turbine, the steam-supply valve must be opened (manually or by other means). When the turbine comes up to the user-determined idle speed, the Peak 150 system takes control of the turbine—the steam-supply valve can then be opened fully. The Peak 150 control includes circuitry for detecting the loss of either MPU signal—this circuitry is automatically overridden for starting.

The turbine can be accelerated from idle speed to minimum governor speed either automatically (by using the remote Idle/Min Gov contacts or by using the front panel start), or manually (by using the panel or remote Raise or Lower commands).

SETPOINT ADJUSTMENTS

Manual Mode
Turbine speed is adjusted solely by the front panel keys and the remote Raise and Lower discrete inputs. The Remote Speed setting analog input is ignored in this mode.

Remote Speed Set Mode
Turbine speed is determined by the Remote Speed Setting analog input. When the Remote Speed Setting Enable contact is closed and the turbine is at or above minimum governor speed, turbine speed will ramp from Min Gov Speed to the remote value at a user-defined rate. Once the speed setpoint output matches the setting of the Remote Speed Setting signal, the speed will change at a new user-defined rate for process control. If the Remote Speed Setting signal is disabled for any reason, the speed setpoint will remain at the last speed and the setpoint adjustment operates as it does in Manual Mode.

Combination Mode
This mode is similar to the Analog Remote Speed Set Mode, except that the speed demand generated by the discrete (front-panel and remote Raise and Lower contact inputs) and the analog Remote Speed Setting signal are compared for the highest value. This highest value is passed on as the commanded speed. If the Remote Speed Setting signal is disabled for any reason, control of the speed setpoint operates as it does in Manual Mode.
PROGRAMMING UNIT

A small hand-held programmer (see illustration) connects to the Peak 150 to permit system configuration and tuning. System constants cannot be changed without this unit, so unauthorized changes are easily prevented by limiting access to the programmer.

CRITICAL SPEED AVOIDANCE

To protect the turbine and skid from excessive vibration, a critical speed band can be defined by the user. While within this band, turbine speed will change at a fast rate (user-defined) and cannot be stopped within the band.

COMMUNICATIONS

Serial communication using the Modbus® * protocol is an option on the Peak 150. The transmission mode can be configured to be either RTU or ASCII mode. RS-232, RS-422, and RS-485 will all be supported through wiring to the proper terminals. Modbus, when purchased, permits communication with Programmable Logic Controllers or Distributive Control Systems. Speed, speed setpoint, alarm and shutdown conditions, and other pertinent control information will be reported on request from a master unit.

*—Modbus is a trademark of Modicon, Inc.

Digital Display  
Five-digit LED speed display  

Power  
Input  
Models are available with these input power requirements:  
24 Vdc  
90–150 Vdc or 88–132 Vac, 47–63 Hz  
Maximum power consumption, all models: 38 W  

Environmental Specifications  
Operating Ambient Temperature  
–25 to +65 °C (–13 to +149 °F)  
Storage Ambient Temperature  
–40 to +85 °C (–40 to +185 °F)  
Humidity  
Designed to meet US MIL-STD-810D, Method 507.2, Procedure II, induced, non-hazardous, cycle 5 (fifteen 24-hour cycles, varying 19–75% humidity, over 33–63 °C)  
Vibration  
US MIL-STD-167, Type 1  
Shock  
US MIL-STD-810C, Method 516.2, Procedure 1  
North American Regulatory Compliance  
UL and cUL listed for Class I, Division 2, Groups A, B, C, & D  

Dimensions  
Width 483 mm (19 inches)  
Height 310 mm (12.2 inches)  
Depth 105 mm (4.1 inches)
